

# Package ‘dcmodydb’

September 27, 2021

**Title** Modifying Rules on a DataBase

**Version** 0.1.2

**Description** Apply modification rules from R package 'dcmody' to the database, prescribing and documenting deterministic data cleaning steps on records in a database. The rules are translated into SQL statements using R package 'dbplyr'.

**License** MIT + file LICENSE

**Encoding** UTF-8

**RoxygenNote** 7.1.1

**Suggests** testthat (>= 3.0.0), RSQLite, covr

**Imports** dplyr, dbplyr, DBI, dcmody (>= 0.1.9), methods, validate

**URL** <https://github.com/data-cleaning/dcmodydb>

**BugReports** <https://github.com/data-cleaning/dcmodydb/issues>

**NeedsCompilation** no

**Author** Edwin de Jonge [aut, cre] (<<https://orcid.org/0000-0002-6580-4718>>)

**Maintainer** Edwin de Jonge <edwindjonge@gmail.com>

**Repository** CRAN

## R topics documented:

dump_sql . . . . .	2
is_working_db . . . . .	2
modifier_to_sql . . . . .	3
modify,ANY,modifier-method . . . . .	3

<b>Index</b>	<b>5</b>
--------------	----------

---

dump_sql	<i>Write generated sql</i>
----------	----------------------------

---

**Description**

Writes generated sql to file

**Usage**

```
dump_sql(x, table, con = NULL, file = stdout(), ...)
```

**Arguments**

x	dcmodify::modifier() object with rules to be written
table	either a dplyr::tbl() object or a character with table name
con	optional, when table is a character a dbi connection.
file	to which the sql will be written.
...	not used

---

is_working_db	<i>Check if UPDATE statement is functional</i>
---------------	--

---

**Description**

Extract UPDATE statements from modifier object.

**Usage**

```
is_working_db(updates, tab, n = 2)
```

**Arguments**

updates	list of update statements object ( <code>modifier_to_sql()</code> )
tab	tbl object
n	number of records to use in this check

**Value**

logical with which statements are working

---

modifier_to_sql	<i>Extract UPDATE statements</i>
-----------------	----------------------------------

---

**Description**

Extract UPDATE statements from modifier object.

**Usage**

```
modifier_to_sql(x, table, con = NULL)
```

**Arguments**

x	dcmmodify::modifier() object
table	table name
con	optional connection

**Value**

list of sql UPDATE statements.

---

modify,ANY,modifier-method	<i>Modify records in a tbl</i>
----------------------------	--------------------------------

---

**Description**

Modify records in a database table using modification rules specified in a modifier object.

**Usage**

```
## S4 method for signature 'ANY,modifier'
modify(dat, x, copy = NULL, transaction = !isTRUE(copy), ...)
```

**Arguments**

dat	<a href="#">tbl_sql()</a> object, table in a SQL database
x	dcmmodify::modifier() object.
copy	if TRUE (default), modify copy of table
transaction	if TRUE use one transaction for all modifications.
...	unused

**Details**

The modification rules are translated into SQL update statements and executed on the table. Note that

- by default the updates are executed on a copy of the table.
- the default for transaction is FALSE when copy=TRUE and TRUE when copy=FALSE
- when transaction = TRUE and a modification fails, all modifications are rolled back.

**Examples**

```
library(DBI)
library(dcmmodify)
library(dcmmodifydb)

# silly modification rules
m <- modifier( if (cyl == 6) gear <- 10
               , gear[cyl == 4] <- 0 # this R syntax works too :- )
               , if (gear == 3) cyl <- 2
               )

# setting up a table in the database
con <- dbConnect(RSQLite::SQLite())
dbWriteTable(con, "mtcars", mtcars[,c("cyl", "gear")])
tbl_mtcars <- dplyr::tbl(con, "mtcars")

# "Houston, we have a table"
head(tbl_mtcars)

# lets modify on a copy of the table...
tbl_m <- modify(tbl_mtcars, m, copy=TRUE)
# and gear has changed...
head(tbl_m)

dbDisconnect(con)
```
